SC2632 | Presenter field guide

October 26, 2026 | 4:30-5:30 PM | Milind Gunjan and Vivek Mayuranathan

OPENING SCRIPT | Milind | Visible slides 1-3 and 5-6

We use a fictional payment API because it makes the availability tradeoff concrete: three copies, at least two Ready. This is generic Kubernetes security, not payment-compliance guidance. Support, operations and monitoring agents share the cluster; a separate copilot proposes guardrails. No incident is assigned until each table chooses one of four cases. Record a decision before each evidence reveal. Your output is a defensible action order and a recovery test, not a claim that the cluster is contained.

Audience translation

Term	Say it this way
Cluster / namespace	Shared platform / resource group
Pod / replica	Running workload unit / application copy
ServiceAccount / RBAC	Workload API identity / its allowed API actions
Kyverno / admission	Checks a proposed resource change; does not stop a running Pod or Secret read
Falco and Kubernetes audit	Detection evidence. The alerts are supplied; live detection is not part of this demo.

Opening handoffs | Establish the system before asking for a decision

Elapsed	Slides	Lead	Room cue
00:00-03:30	1-3, 5-6	Milind	Set the premise, common facts and unknowns, agenda, platform map and four security boundaries. Slide 4 is a hidden backup.
03:30-05:30	7 (8 backup)	Vivek	Separate the bounded Python harness from model choice; show task inputs and trust boundary. Slide 8 is hidden.
05:30-07:15	9-10	Milind	Trace one supplied intent clause to one tested control; point to unmet requirements.
07:15-08:15	11	Vivek	Q0-Q3 is a human-declared posture; each layer needs positive and negative verification.
08:15-12:00	12-14	Both	Orient the record, assign a case and table roles, set the constraint and service floor.

Setup language | Slides 12-14

No Kubernetes experience, laptop or YAML is required. Tables choose one case on slide 13; the payment platform is the common setting, not the assigned incident. Keep participant pages 8-9 and CONTROL-REVIEW page 2 sealed until called.

Participant roles: incident lead calls the decision; recorder maintains pages 6-7; evidence analyst checks claims; independent reviewer challenges one assumption. Combine roles at smaller tables. Presenters both circulate and run the exercise; there is no separate floor facilitator.

Decision rounds | Lock choices before the evidence

Elapsed	Slide	Lead	Participant action
12-16	15	Milind	Page 6: write behavior, identity, dependency to preserve and service floor.
16-20	16	Vivek	Lock approve / modify / reject / escalate; name one change and missing test.
20-23	17	Milind	Check exception approver, exact scope, owner, expiry and revocation test.
23-27	18	Vivek	Set Audit / Warn / Deny per control; define promotion and rollback evidence.
27-28	-	Both	Unseal page 8 at minute 27; use this minute to transition.
28-35	19	Both	Page 8: order evidence, action, scope, service floor and verification.
35-39	20	Milind	Open page 9; revise or defend and mark the fact that changed the decision.

60-minute run of show

Use elapsed time. Lock each decision before revealing new evidence. Hear at most two 20-second reports per round.

Elapsed	Slides	Lead	Participant action / reveal cue
39-40	21	Milind asks; Vivek tallies	Keep slide 21 projected. Read all four concise setups and collect one hands-up vote each; tally, do not discuss.
40-41:15	22	Milind + Vivek	Reveal additive DNS allows; ask which allowance to change and what UDP/TCP test confirms it.
41:15-42:30	23	Vivek + Milind	PDB counts Ready Pods, not trust. One voluntary eviction is allowed at 3 Ready; Q3 blocks replacement; a second is denied at minAvailable 2. Direct deletion bypasses the PDB.
42:30-43:30	24	Vivek	Reveal the debug subresource gap; ask who owns the missing test and which forensic image is approved.
43:30-45	25	Milind + Vivek	Reveal the native Q1 guard when Kyverno is down. State its matched-write scope; it does not cover all administrator actions.
45-46	26; backup 35	Vivek	Case D: compare the locked copied-token prediction with the separately recorded synthetic lab result.
46-49	27	Vivek + Milind	Give CONTROL-REVIEW page 1; keep page 2 sealed. Team names the test scope and missing owners.
49-51	28	Milind	Reveal page 2. One rule passed 6/6 tests; three intent clauses remain unresolved. Slide 29 (model cost) is a hidden Q&A backup.
51-55	30	Milind + Vivek	Page 7: write exit evidence, who may lift Q3->Q0, and the rollback condition.
55-58	31	Both	Illustrative worked record; tables score with REVIEW-SCORECARD; each person writes one action + owner + verification.
58-60	32	Both	Resources and repository; Q&A.

Demo and recovery | Keep this separate from live enforcement

Before doors	During the demo
Open the deck, rendered PDF, participant pack and pre-recorded fallback locally. Check projector text size and presenter notes. Run demo.py --check; require ready: true and Kyverno 1.19.1.	PATH=$PWD/.venv-session/bin:$PATH .venv-session/bin/python tabletop/congress-2026/demo.py --mode reference --scenario a --out output/congress-2026/live-HHMM (repository root; fresh directory each run). Offline source and fixtures only: no model, PR or cluster change. Never show env files.
If preflight or the command fails, stop troubleshooting. Keep the audience in the exercise.	In the slide show type 33, Enter (34 for fixture outcomes), then 11, Enter to return. Say: 'This is a dated recorded fixture result, not a fresh cluster run.'

Print per table (12 tables + 2 spares): participant pack single-sided with pages 8 and 9 folded closed; CONTROL-REVIEW page 1 and page 2 as separate sheets, page 2 face down until slide 28; one REVIEW-SCORECARD. Protect participant writing and the four-minute recovery round. If five minutes behind at the recorded findings, use the compressed schedule in the co-presenter cards; never add a provider call or another demo.
